

Professionals Speak Out...

"At long last, there is a new medical system for individuals 'at-risk' for medical emergencies. As a school Principal, I am extremely pleased with the features that the **@Risk Rescue System** offers. Safety has always been the number one priority for educational staffs, and now students and their parents can rest assured that medications, vital information, and procedures are efficiently stored and readily available. As important, individuals are recognized for their medical needs in a very visual and efficient way. I highly recommend the **@Risk Rescue System** for all schools and large organizations."

Ane Marie Bennett
School Principal
Victoria, B.C

"I believe that the **@Risk Rescue System** will be a huge help to educators in assisting us to keep students safe, both in school and, with its portability, on field trips or at other events beyond the classroom."

Keith McCallion
School Principal
Victoria, B.C.

"When seconds count in a medical emergency, the **@Risk Rescue System** will make a profound difference. This product provides direction and medication to initiate unmistakably better outcomes to any patient in need. With this system in place, it will make my job as a paramedic much easier. It will undoubtedly save lives and lessen the severity of medical emergency problems."

David J. Tubman, MICP
Mobile Intensive Care Paramedic
Seattle, WA

A Message from David Naysmith M.D.

"As a practicing physician, I have responded to many emergencies in hospital settings. Surrounded by well-trained staff with easy access to medications, most emergency problems can be easily resolved.

I have also faced medical emergencies in 'out of hospital settings' where equipment or medications were not available. When doing so, I felt helpless and frustrated, and the outcomes were not always favourable. Even my most respected colleagues, who deal with medical emergencies on a daily basis, are powerless in such situations.

It became apparent to me, that an untrained person could provide life-saving treatment for any given problem, if they have a simple protocol and the appropriate medication. With this in mind, I designed the **@Risk Rescue System** to manage known, potentially life-threatening, medical crises, where seconds, not minutes, are critical. Each module is completely portable and custom designed for the individual at-risk."

Dr. David Naysmith
Designer, @Risk Rescue System

If someone you know has any of the conditions described in this brochure, or any other condition where immediate intervention is critical, please tell them about the **@Risk Rescue System** – it could save their life!

Anaphylaxis
Asthma
Hypoglycemia
Epilepsy
Angina

When every second counts

A Medical Crisis Response System

The **@Risk Rescue Medical Crisis Response System** offers a reliable means for responding to a medical emergency, such as anaphylaxis, that can be precipitated by a severe reaction caused by bee stings, peanuts, shellfish, or latex. It can also be used when responding to severe diabetic hypoglycemia, asthma attacks, epileptic seizures, angina, and almost any other medical emergency arising in people with known risk factors.

Always There When You Need It

The **@Risk Rescue System** increases awareness of such problems and centralizes protocols and medications required to manage these life-threatening conditions. It can be used anywhere people gather, such as schools, day care centres, factories, office buildings, or recreation centres. Individual kits can be used 'on the go' in cars, in boats, at the cabin, or at home.

Sabrina's Law

In 2003, a young Ontario school girl, Sabrina Shannon, died from anaphylactic shock. Her death resulted in the passage of Bill 3, 'Sabrina's Law'. The Bill requires that every School Board in Ontario establish and maintain a policy around management of anaphylaxis. This must include, among other things, an individual plan for a pupil with an anaphylactic allergy. Details are required on the type of allergy, appropriate treatment, a readily accessible emergency procedure for the pupil, and storage for epinephrine auto-injectors where necessary. The **@Risk Rescue Medical Crisis Response System** meets these requirements.

The Kit can be carried in a 3 ring binder

The System can be easily rolled-up and transported

The @Risk Rescue System – How It Works

The key component of the **@Risk Rescue System** is the Rescue Kit. Each Rescue Kit displays a photo of the individual who is at-risk, details about their medical condition, their medications and instructions for administering them, consent forms, and other vital information. Each Kit is a free-standing emergency response package that can be kept at home, with the individual (in a briefcase, three ring binder, back pack), or can be attached to the **@Risk Rescue Station**.

The **@Risk Rescue Station** is wall mounted in a highly visible location, and holds up to 20 **@Risk Rescue Kits**, allowing staff to familiarize themselves with the individuals at-risk. It can easily be rolled-up and transported as part of an emergency evacuation, should an earthquake, fire, flood, or other catastrophic event occur.

A practicing physician designed the **@Risk Rescue System** to become the standard of care for people known to be at-risk. Each component has been priced to be affordable to all.

Rescue Kits are customized for each individual and can be used alone or as part of the **@Risk Rescue System**.

The Rescue Station should always be highly visible.
